The Brånemark Hybrid Prosthesis

The most common use for Dental Implants is to replace missing teeth by acting as anchors for a prosthesis. The patient pictured above had lost all her teeth at a fairly early age. Dental implants were used to anchor her lower prosthesis (Brånemark Hybrid Prosthesis) replacing an existing lower denture that was totally unsatisfactory. This patient has had this restoration for approximately eight years now and has had no problems during that period. Select an item from the list below to see more about how this particular patient was treated with dental implants.
