

What happens if I have dental implants and they are rejected

Last Updated Sunday, 18 February 2007

Occasionally dental implants do fail or, as some people say, they are rejected. In many instances, they can be replaced with another implant, usually of a slightly larger size. Failure rates should be about 1-5%. This might be somewhat higher in smokers and people with compromised immune systems. The key element to determining implant success is proper diagnosis and treatment planning.
